Thessaly

acres a day with a tractor. "Before the war," he went on to say, "a peasant who tried something new was considered an amusing person with a loose screw in his head. Even the agriculturists were received with 'what have those educated people got to tell us who have callouses from working?' Also, the agriculturist has learned more about agriculture and more about people, changing for the better."

The director's wife agreed with what we had learned from Alekos about the effect of mechanization upon woman's work. She did point out that machine harvesting and threshing had relieved the housewife of an old burden of feeding many people for long periods of time when the work was done by hand. However, the women still plant tobacco and cultivate cotton. Men are helping out a little more, but this hard field work in Thessaly is still a woman's job. Here again there is some compensation for the women. Although they have as much work now as before, they have more money. They will change into better dresses in the evening and go for a walk on a weekday, something much less common before the last war. Finally, the director's wife pointed out, those families who own twenty to twenty-five acres of land have acquired ease and prosperity and are becoming a well-to-do peasantry.

Elsewhere around Larissa we inquired about the spread of mechanization. The tractor dealers in the town put Alekos' problems in a somewhat different light. We learned, for example, that a 46-horsepower tractor, with starter and pneumatic tire wheels, cost 55,000 drachmas ($3,667); the purchaser had to pay 40 percent in cash and could sign a bill for the remaining 60 percent, payable after 18 months to the Bank of Greece at the rate of 16 percent interest. Dealers and some of the local government officials considered this rate most oppressive.

A second problem was that of spare parts, most of which had to be imported. Foreign-exchange difficulties and import restrictions make this difficult; when the parts were not available, the owner of the tractor was greatly inconvenienced, to put it mildly. We got some idea of the problem of spare parts when we learned that there were 25 dealers of tractors of different makes in Larissa alone. The dealers attempted to teach the purchasers how to use the machine and, a year or so before, the government had set up traveling schools which instructed in the operation and care of the tractor and afterwards gave examinations for licenses. That year, out of 1,200 farm workers examined, only 700 were given a license.

Dealers also indicated that the buyer of a tractor usually ordered a plow and a disk-harrow, with many requesting grain drills. This equipment adds greatly to the total cost. Most of the tractors were bought by individuals or by a group of three to five peasants, with only twenty to twenty-five tractors belonging to cooperatives.

In the tractor land of Larissa everything seems fine now. As in the case

/55 cont./

The low water table of only 18 to 24 feet, the flat land that will make irrigation easy, the nearness to the railroad station and to a big city, are the outstanding privileges of the farmer of Megali Vrisi to shift his farming methods and produce enough to improve his family living conditions. Nothing could meet his economic needs better than the combination of dairying with small cereals. 241

/56/ Cooperative Activities. A village system and the type of farming such as in Megali Vrisi makes cooperative movement essential. The limited capital of the individual farmer makes it hard to conduct his farming operations successfully. The type of living together has brought them the spirit of cooperation. Before any kind of organized cooperative movement started, there was already very close cooperation among the villagers in hiring a common shepherd, sharing alike in the erection and care of the school and church, repairing the roads, helping each other at harvest and in numerous other ways. The cooperative spirit was taught to them in the family from the type of family life they were living. Nothing explains so well their success in being able to establish themselves in the village, in such a short time as work-through the cooperative to help each other. 621 476 [241] [474] [866]

Since the settlement of the village the people organized a cooperative with a capital of $15,000. A threshing machine and a tractor of 64 horsepower was bought. All the farmers thresh their cereals and pay 11% of the crop. With the accumulated capital a flour mill with four grinding stones was built. The flour mill, besides serving the village, draws customers from the neighboring villages. The flour mill charges 3% /57/ of the grain. The cooperative organized a grocery which serves the members. It also bought 3 improved pure-bred bulls for the village herd. The cooperative has its own 15 acres of land where it conducts experiments for the farmers of the village with fertilizers, seeds and grass plants. All loans from the Agricultural Bank are made through the cooperative. All the Caucasians are members, but only 65% of the Thracians are members. The cooperative is one 241 474 [407] [256] [444] [232] [621]

/60 cont./

Rotation of crops is neglected due to the high price of wheat. The best land is put into wheat and the poor land into oats and barley. The recent introduction of vetch may revolutionize the rotation system and may help answer the livestock management problems.

The Local Groceries. Out of five groceries two have closed due to depression years of 1930-33. The three groceries are doing well only on books. Their /61/ non-collected capital exceeds 3 times their active capital. The cooperative grocery gives keen competition but its credit is limited to members and it has a successful way of collecting the debts at threshing time with the cooperatives' threshing machine. Just before threshing the three local groceries treat their customers with wine and whisky so as to be able to collect their debts. All kinds of methods are used at harvest time.

The local grocery owners do their farming too and in most cases all their farming jobs are done by the farmers in paying their debts. No grocery man could make his living out of grocery business alone, but keeps it for spending his leisure time.

PART IV. HABITS OF CONSUMPTION

Household Expenditures. People who lose all they had two to four times in their lifetime will not want to buy anything unless its need is essential. Life is more or less simplified and the household expenditures run very low. In one of the accounts we find that for household expenditures the farmer spent 2.500 drs. ($16.66). This sum is too high. We must remember that these farmers were just settled and had nothing whatsoever to start with.

/62/ A few small chairs, a rough table, a few wooden spoons and a few copper kitchenware make the kitchen's utensils. Pictures of a few relatives and their own hang on the wall with a few handmade embroideries.
